

Domain logic

1. 1 account: M activity_log.

One account generates multiple activity logs, but each log only pertains to one account.

2. 1 account: M measurement.

One account can document multiple measurements for themselves, but each measurement pertains to only one account holder.

3. 1 account: M my_closet. One account can have many items in their closet, but each item can only belong to only one account.

4. 1 parent_category: M my_closet.

One parent category can be used to classify many sell closet items. Each item in my closet can only be listed under one parent category.

5. 1 parent_category: M child_category.

One parent category contains many child categories. Each child category can only belong to one parent category.

6. M measurement: M sell_closet.

One measurement can apply to multiple sell closet items, and each sell closet item needs multiple measurements (M:N), resolved by the sell_measurement bridge table. Only items listed for sale get measured.

7. M platform: M sell_closet.

The bridge table between platform and sell closet allows for cross listing; one item can appear on many platforms, and one platform can host many items, resolved by the sell_platform bridge table.

8. 1 platform: M shipping.

One platform sometimes offers multiple shipping options. Each of the shipping options are exclusive per platform.

9. 1 my_closet: 1 sell_closet.

One item from my closet can be moved to the sell closet; it remains the same item no matter which closet it's in and moving it is optional. An item in the sell closet can be moved back to my closet at any time.
